Who exchanges information with PK DTS?

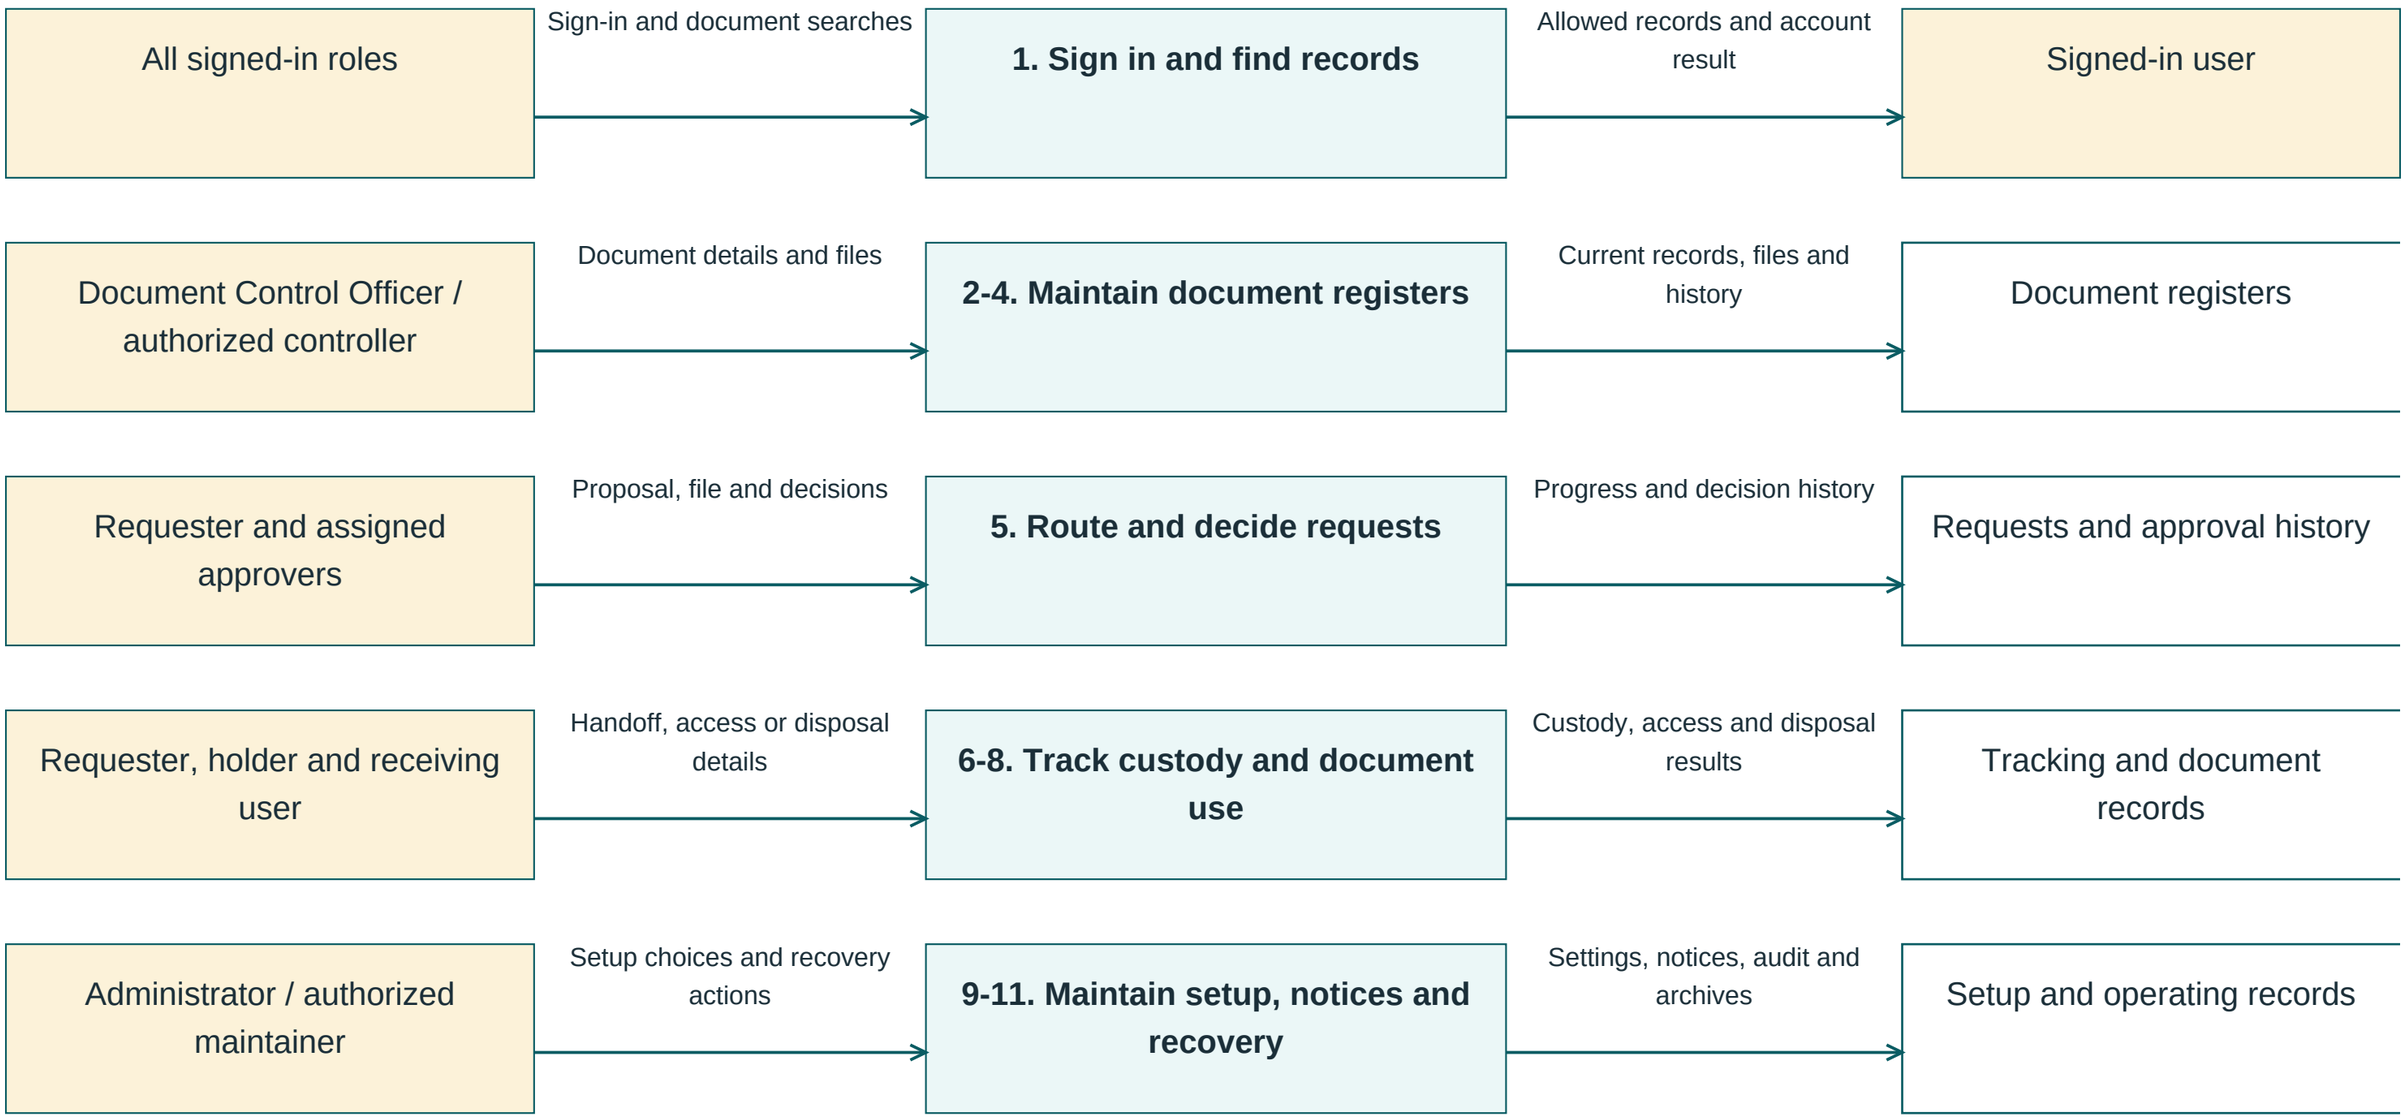

Context diagram: all five supplied account roles and the information each sends and receives.

These are supplied roles, not a live account list. Roles can overlap and custom roles can be added. Requester's leader, requester confirmation and receiving user are assigned responsibilities, not additional fixed role names.

Main information flows

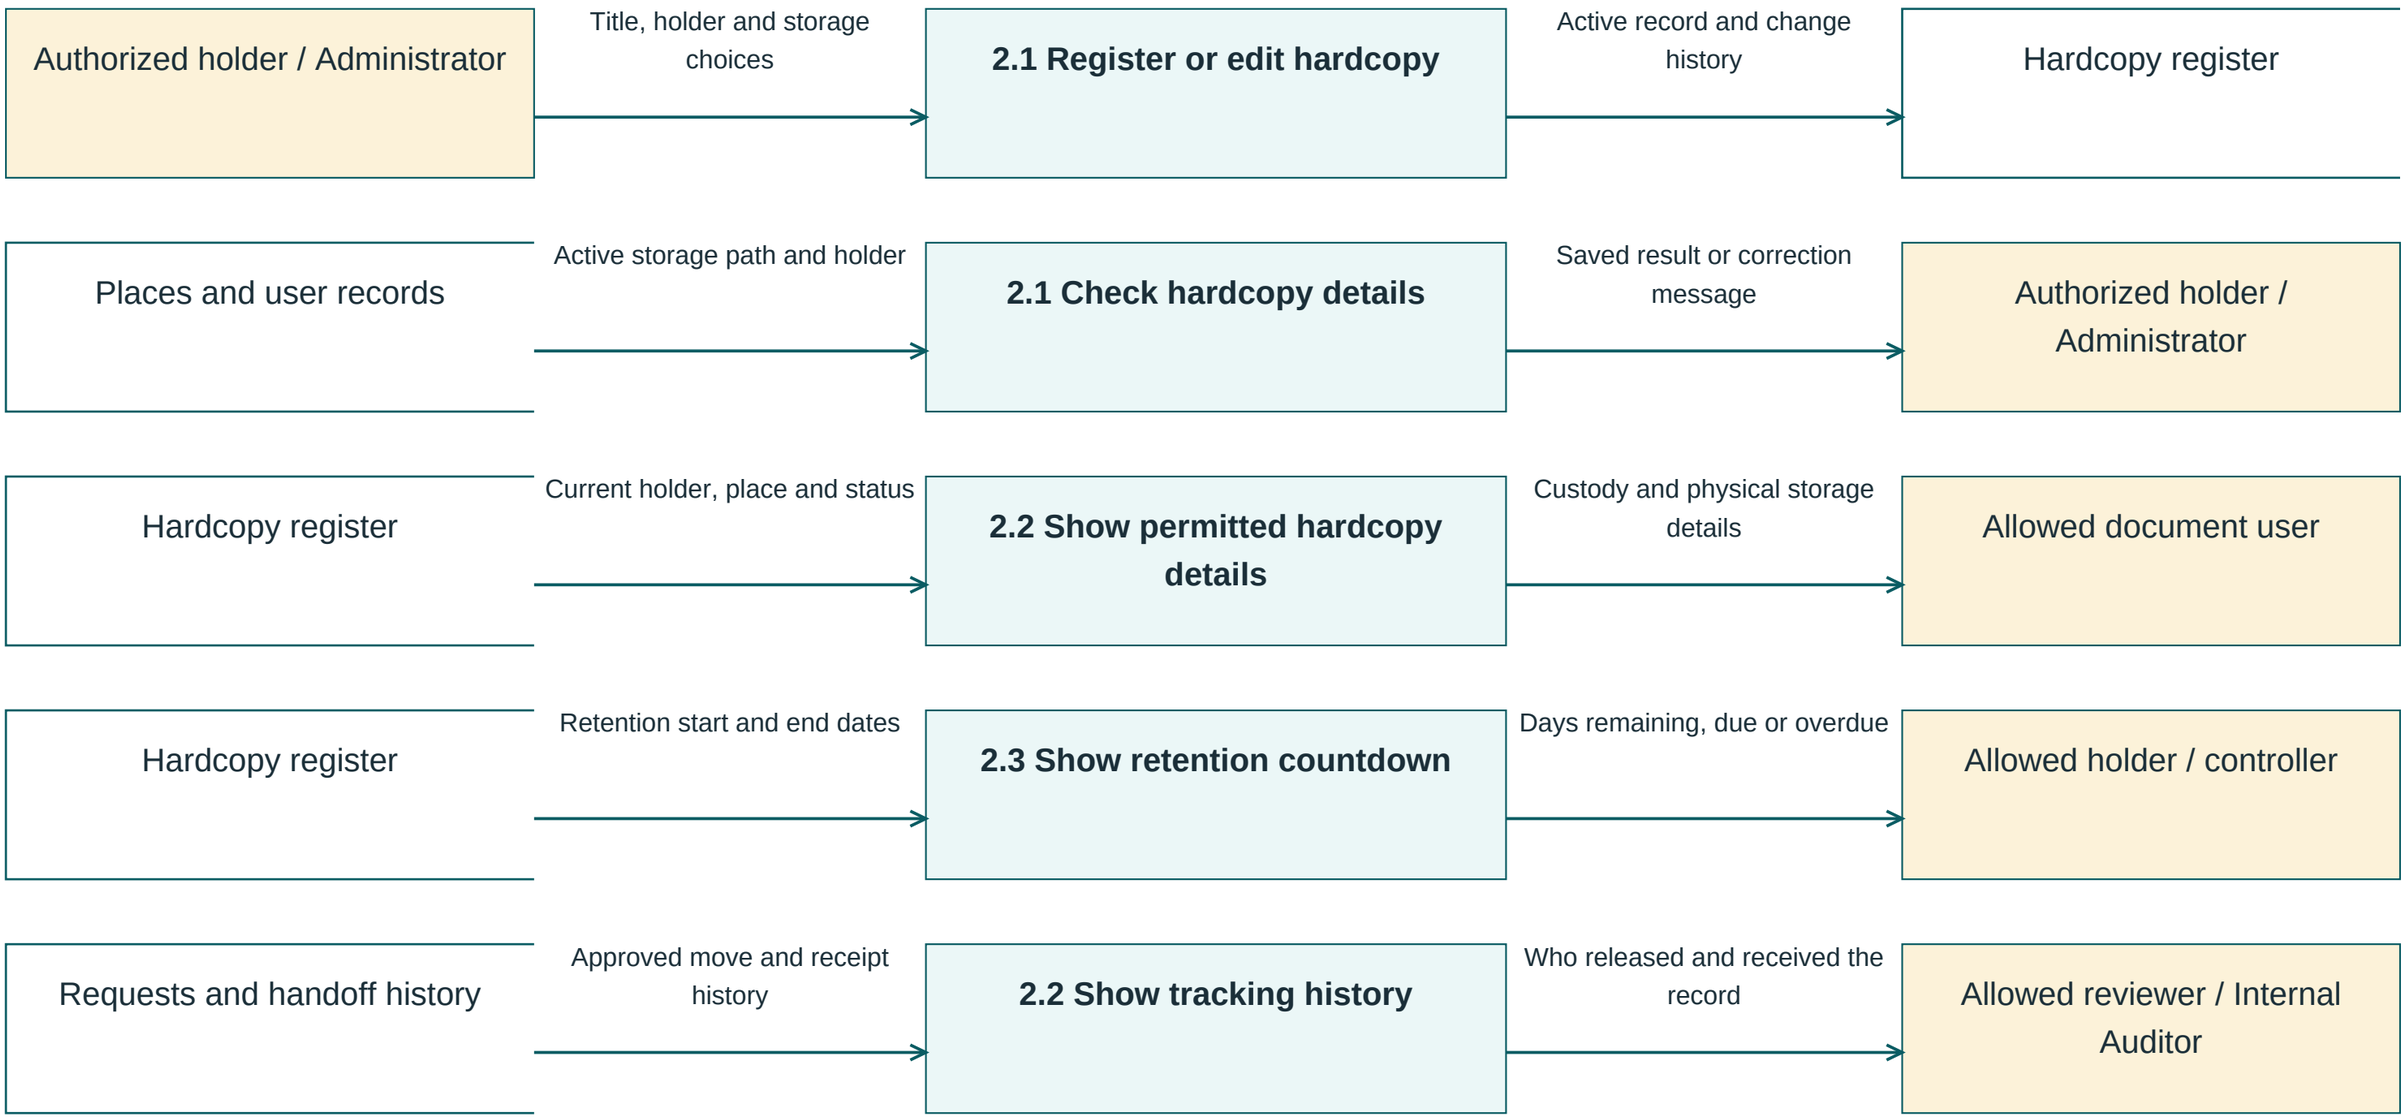

Overview: people provide information, the system carries out an activity, and records or results are returned.

Reading key: boxes are people or activities; open-ended boxes are saved business records. Arrow labels name the information passed. Detailed pages separate each main activity.

2. Hardcopy records, holders and storage

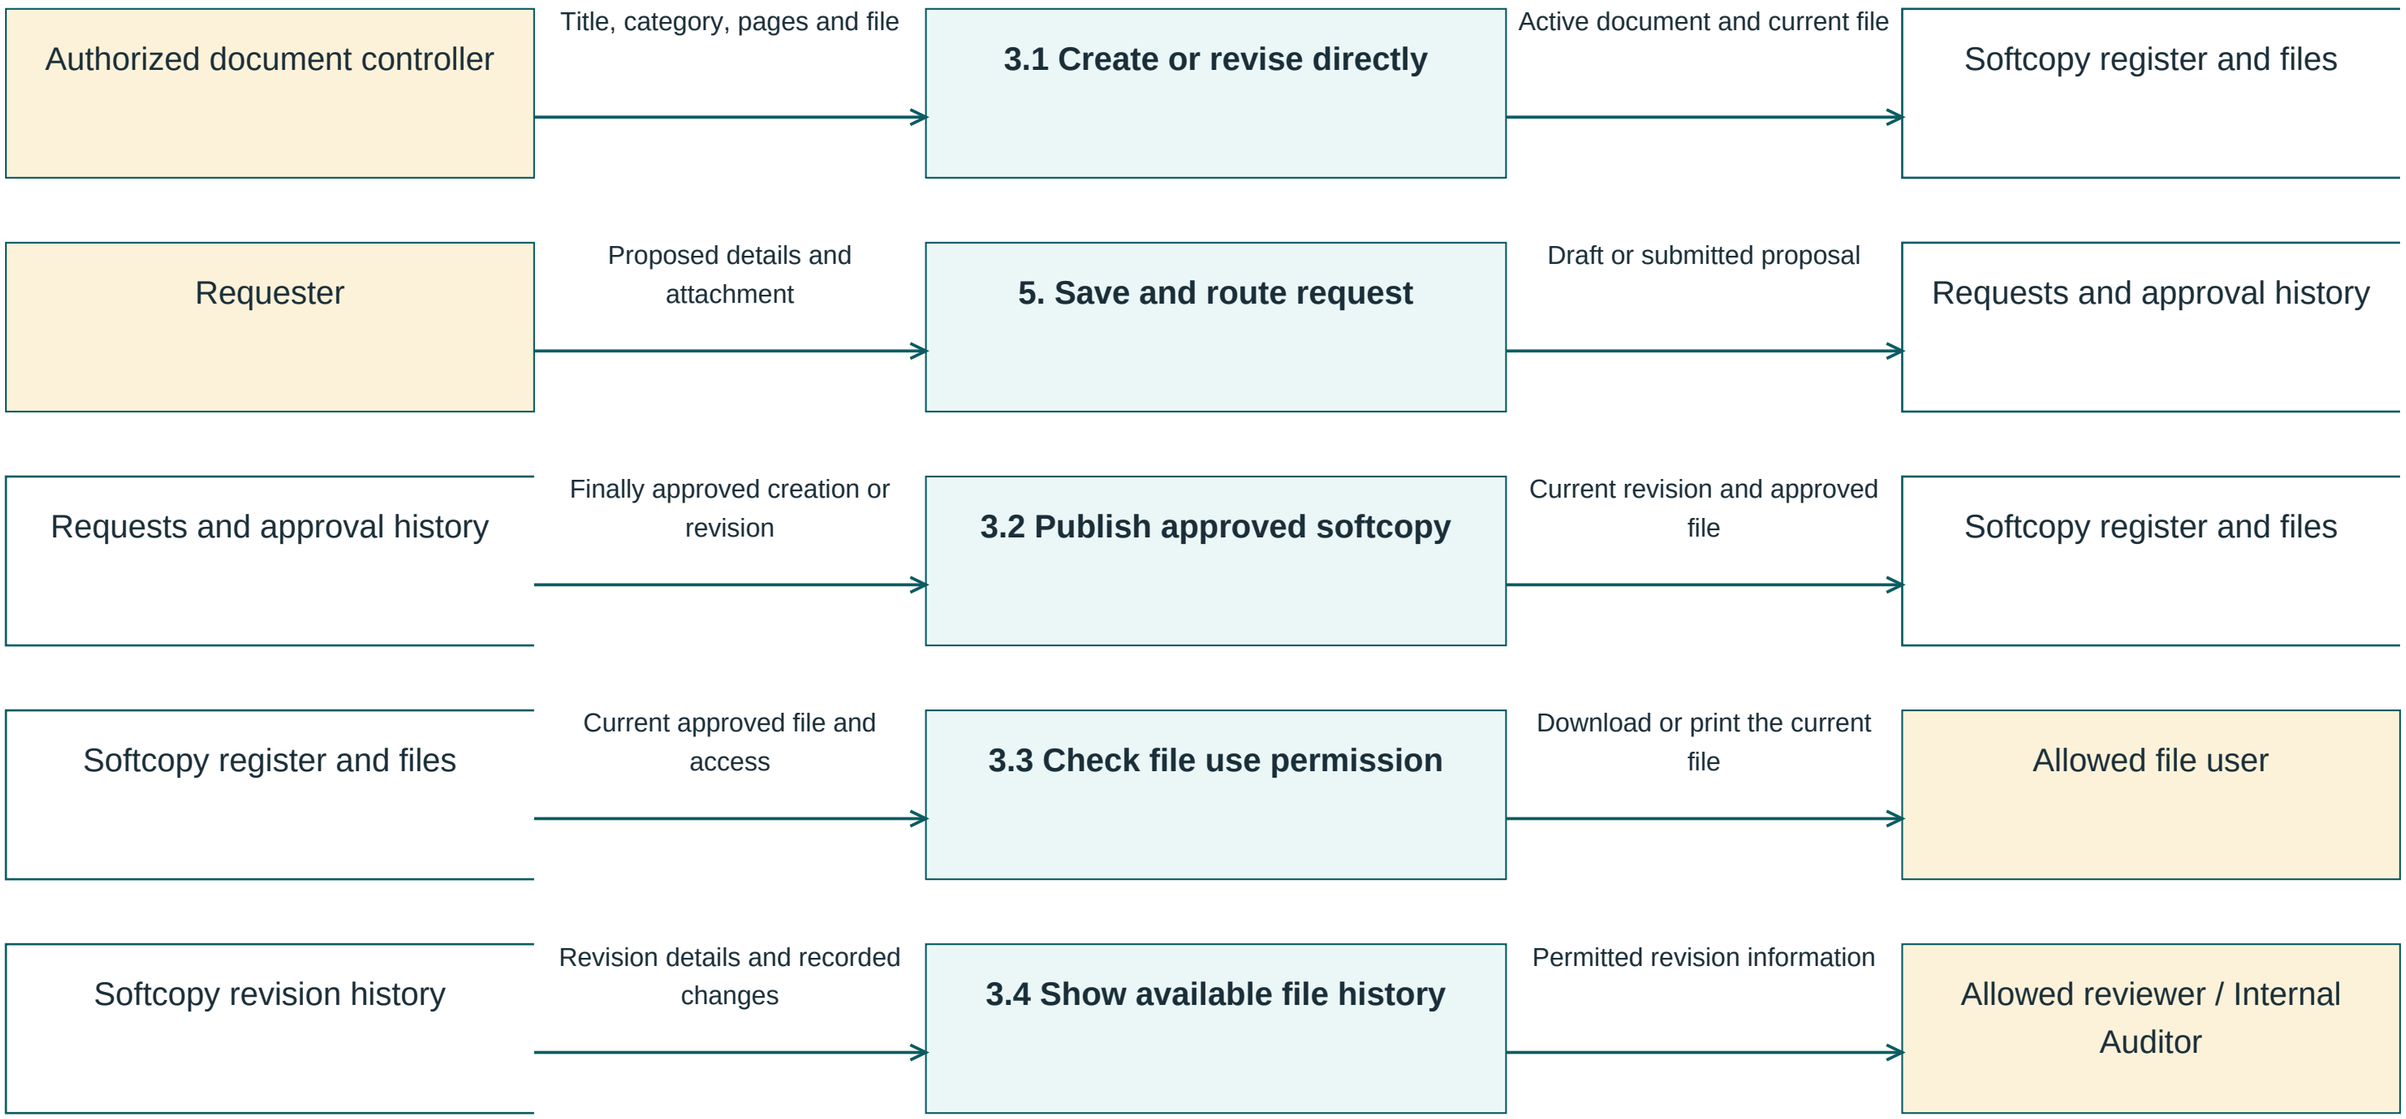

Hardcopy registration and editing are direct actions. Physical transfers and other requests have separate flows.

Storage follows Area > Specific > optional Asset > Location. Retention reminds people to review a record; it never disposes of a document automatically. New hardcopy create or update requests are unavailable.

3. Softcopy creation, revision and file use

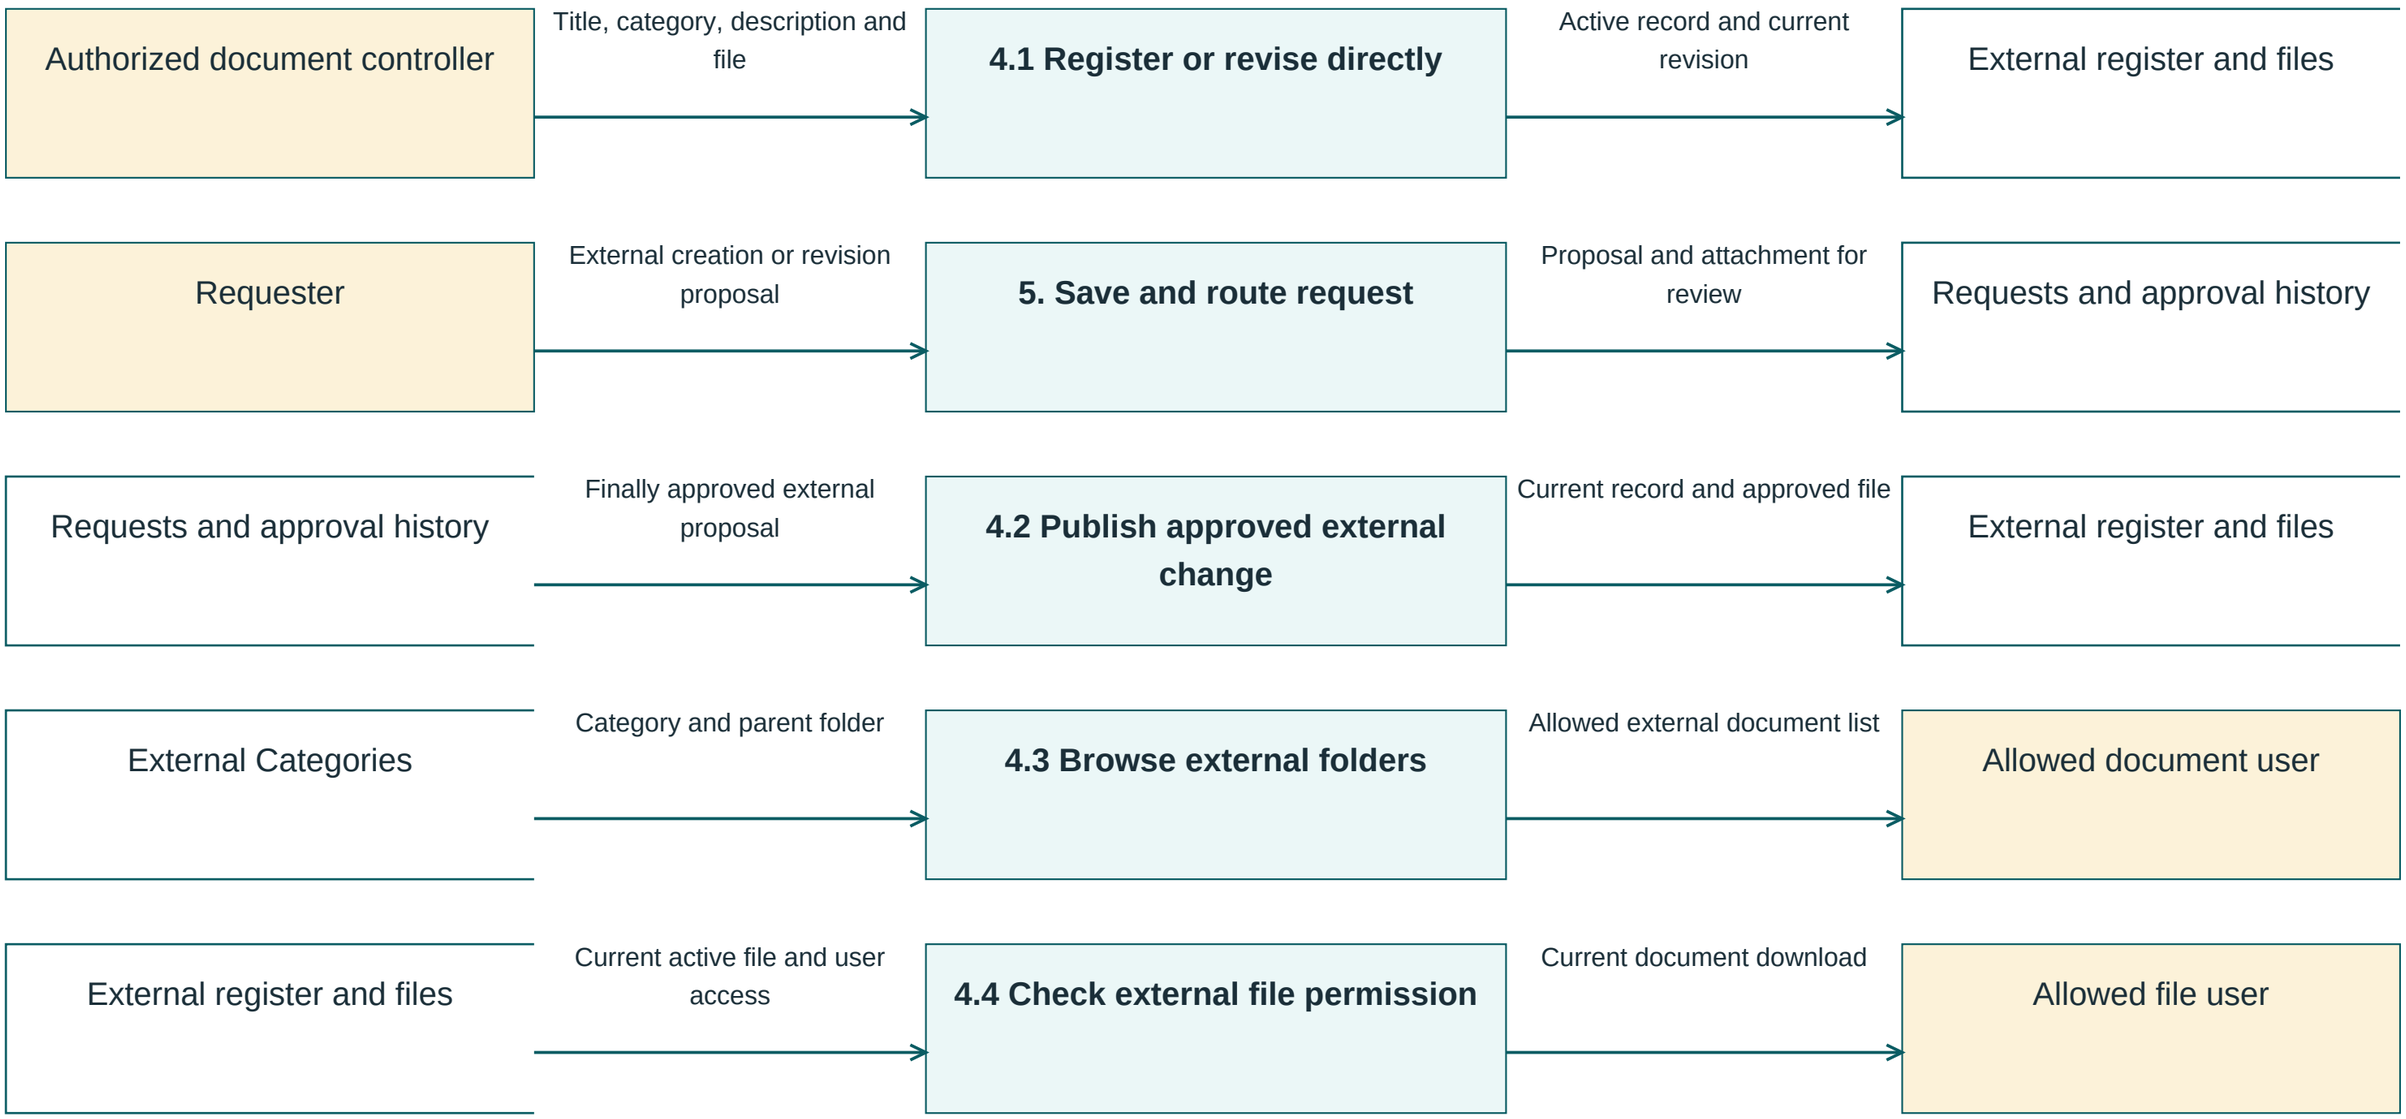

A direct action publishes immediately. A proposed creation or revision waits for its final approval.

Creation uses Softcopy Categories and automatic document numbering, with optional series. Revision keeps the document identity and advances its revision. New softcopy cancellation is unavailable; permitted direct disposal is separate.

4. External document registration and revision

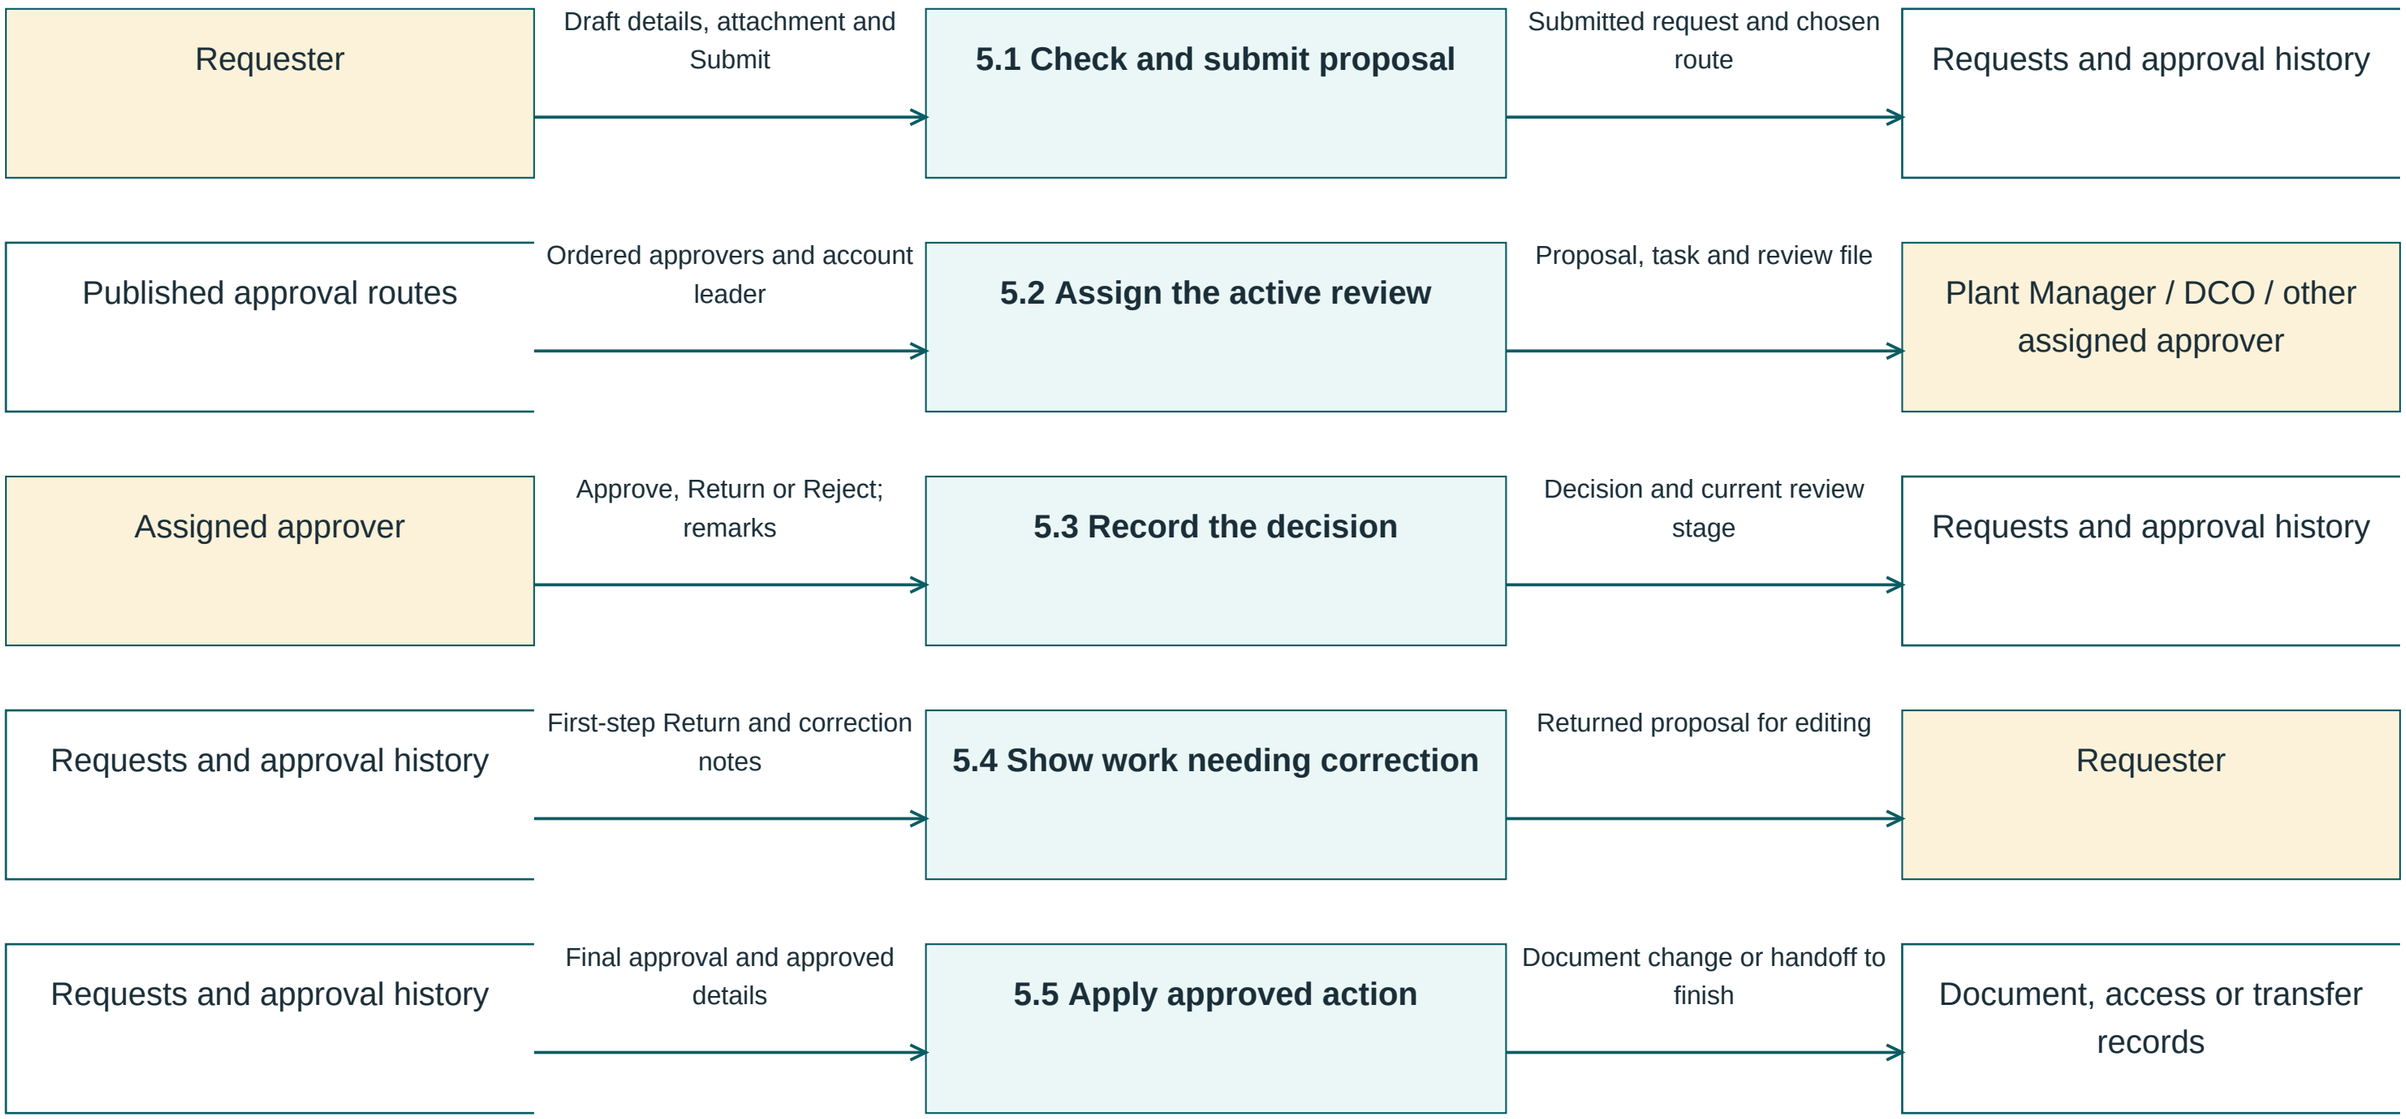

External Documents have their own categories. Both direct and approval-based creation and revision are available.

A new attachment is required for creation and revision. Revisions advance automatically. External Documents do not use retention dates, and their register offers Download for the current file.

5. Requests, approval decisions and corrections

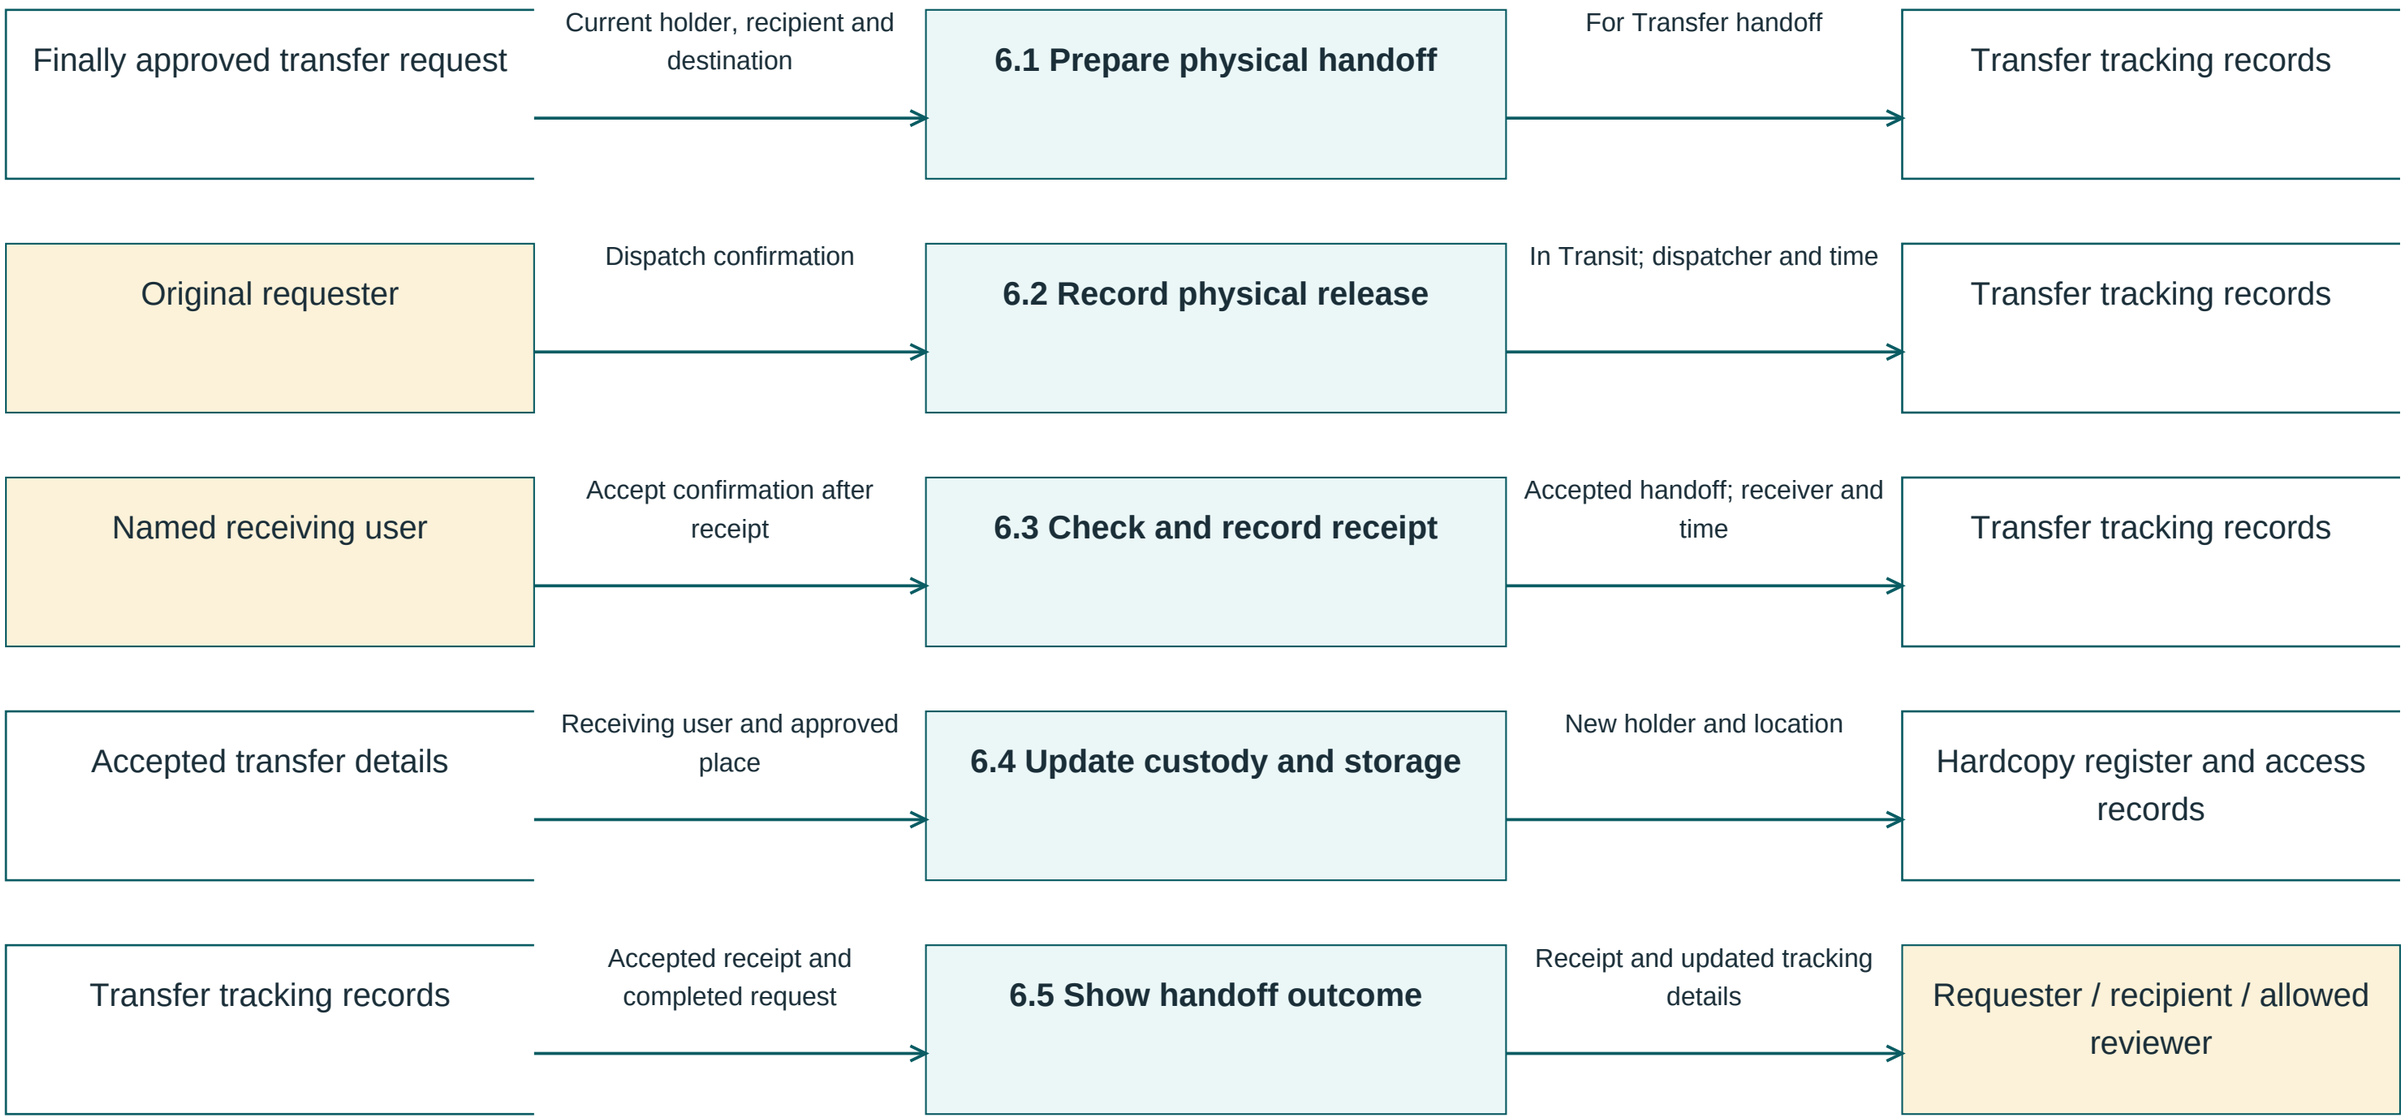

The published route assigns each review in order. Decisions and proposal changes remain traceable.

A later-step Return reopens the preceding approver's task. Reject ends the request. The requester may correct and resubmit a Returned proposal; its original route is retained. Opening a notification is not a decision.

6. Approved physical transfer and receipt

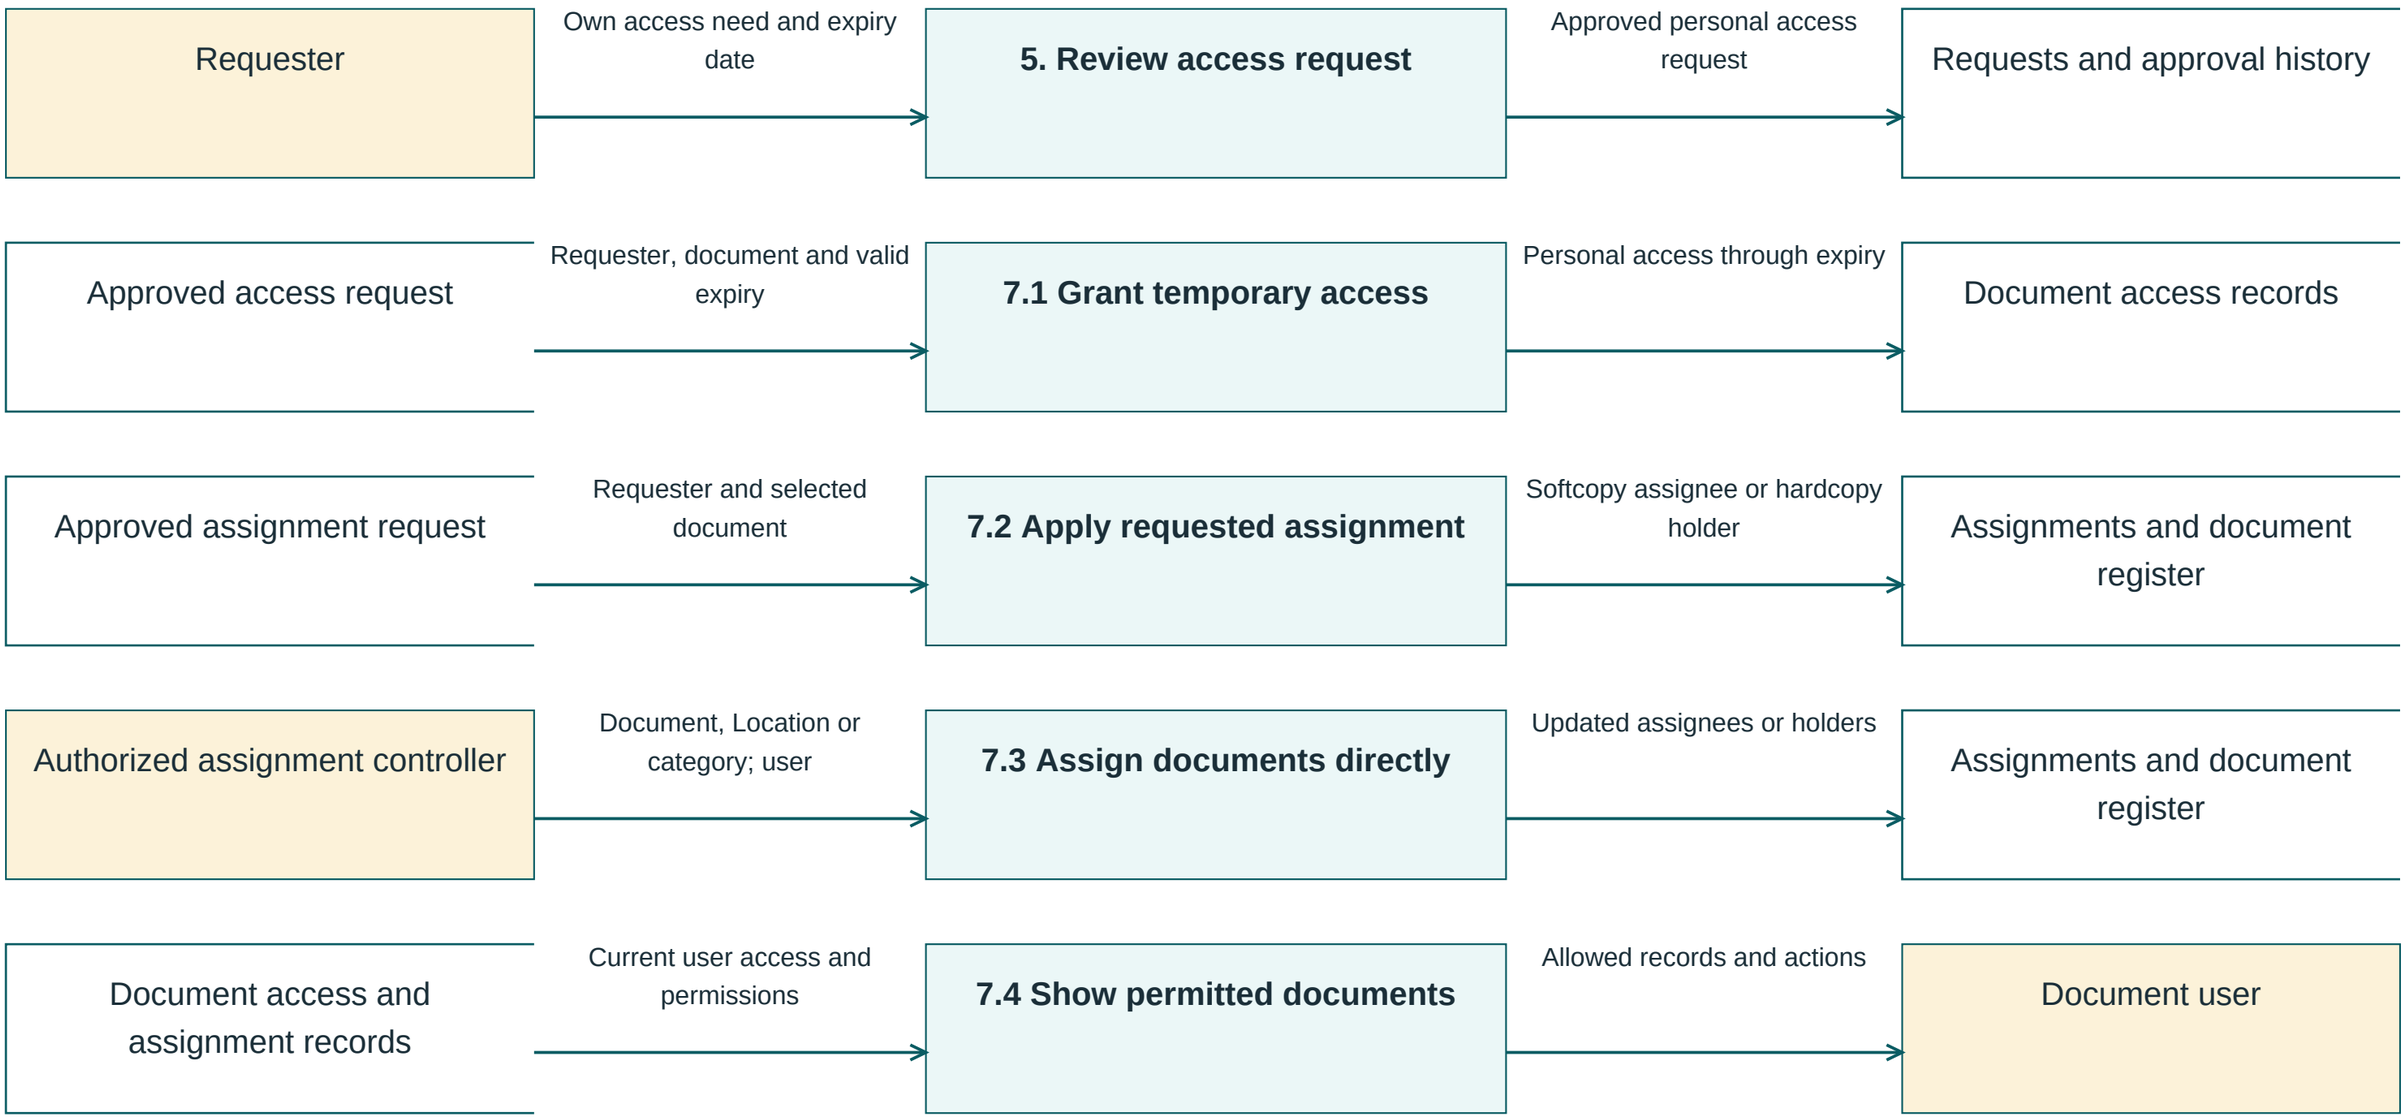

The transfer records physical release and receipt. Custody and storage change when the receiving user accepts.

Only the original requester can Dispatch; only the named recipient can Accept. Acceptance checks the document, holder and approved place. It also revokes the previous holder's personal hardcopy grants when custody changes.

7. Temporary access and document assignment

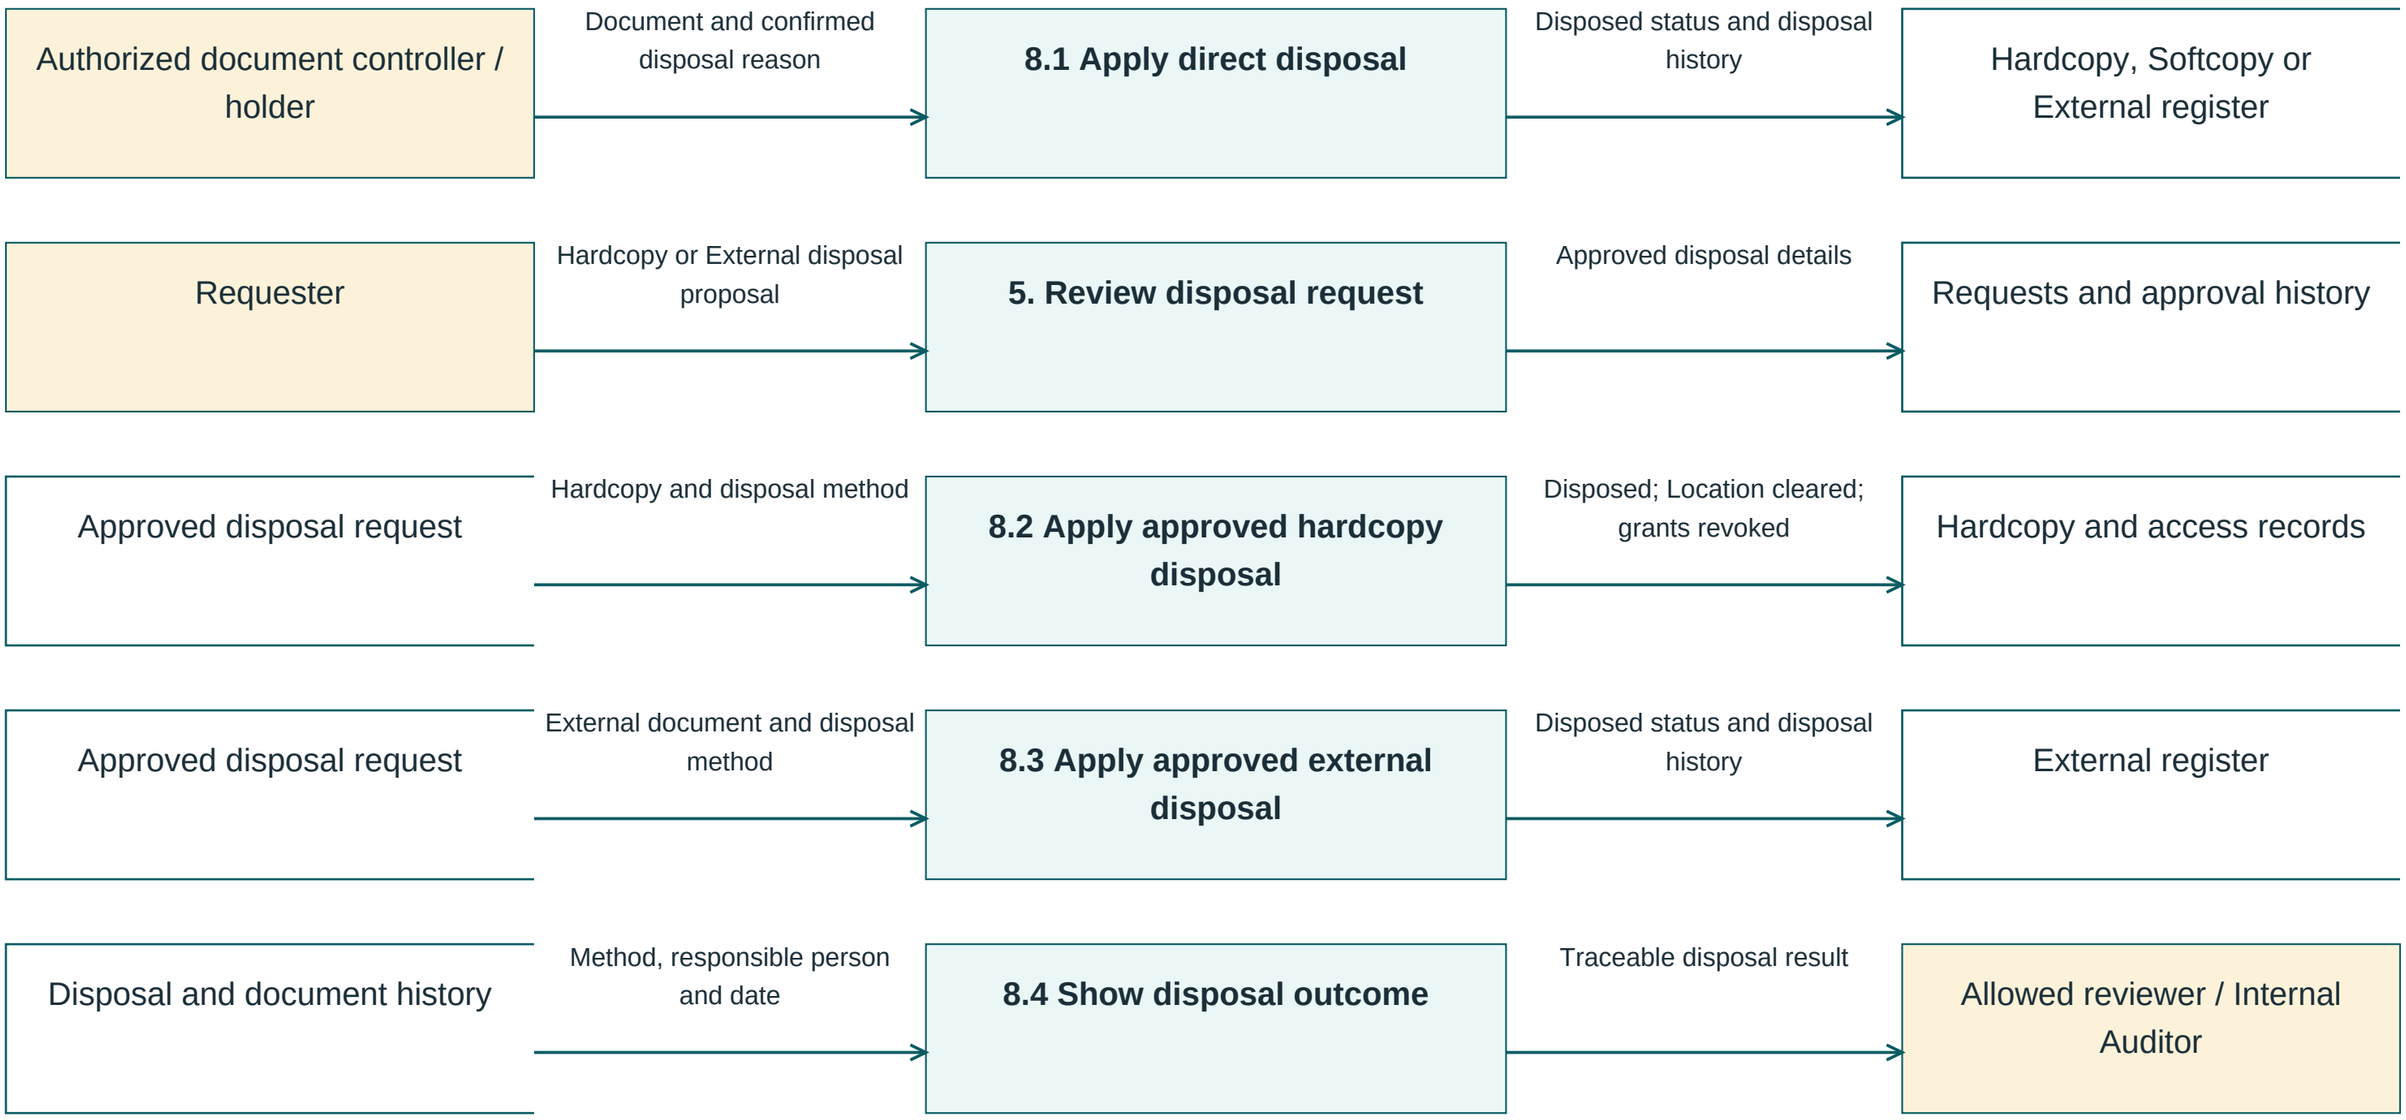

Access grants, assignments and physical transfers are different actions with different results.

Requests for access or assignment are for the requester and support Hardcopy or Softcopy. Hardcopy assignment changes the holder without moving storage or using Dispatch/Accept. Direct hardcopy assignment checks for active handoffs.

8. Direct disposal and disposal requests

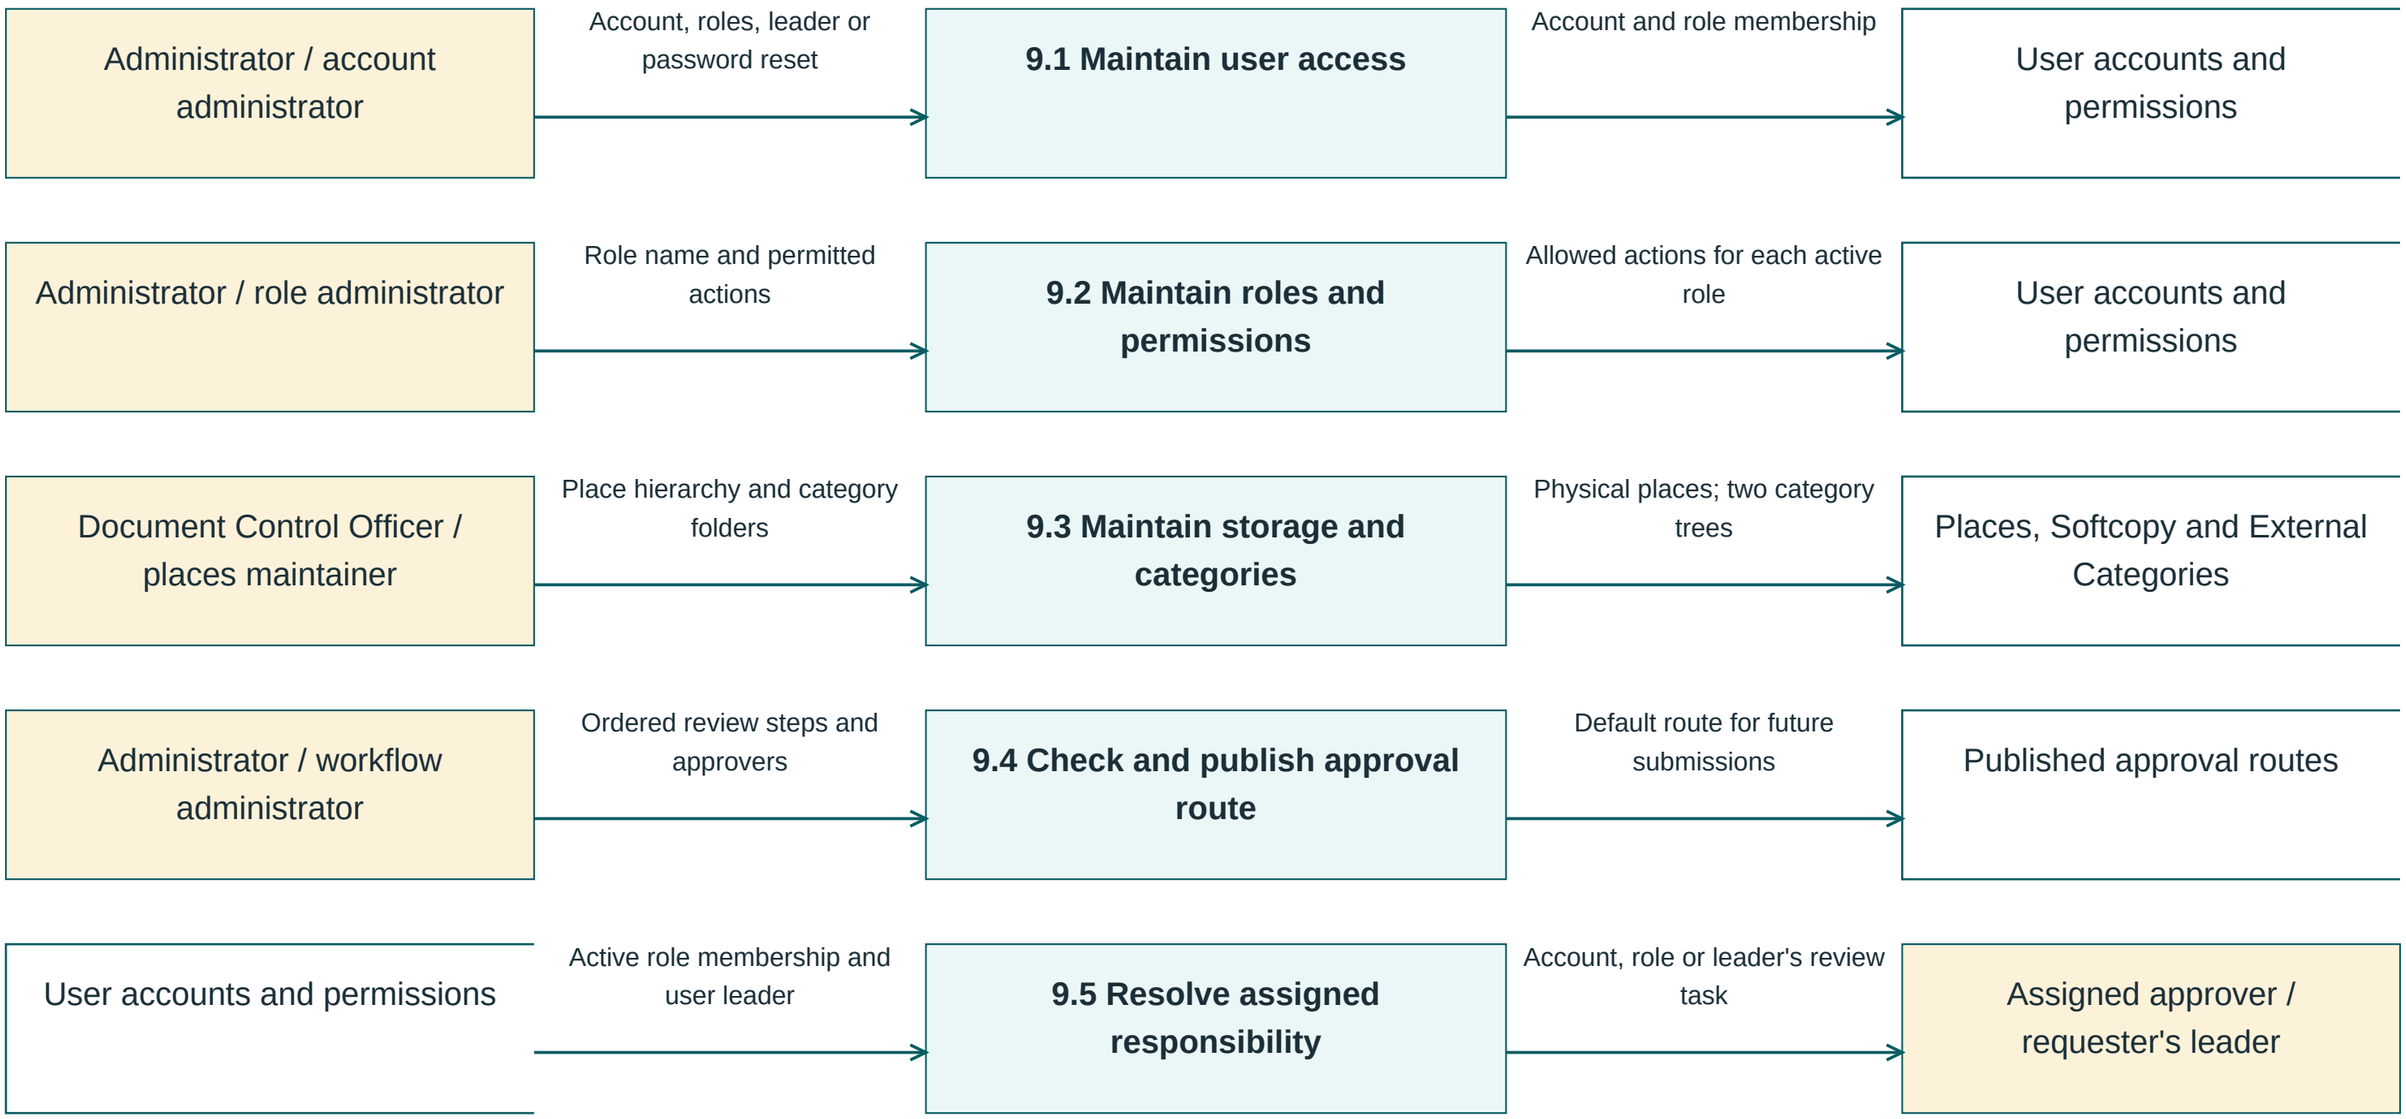

Disposal records why a document is no longer active. The available path depends on the register and permissions.

Direct hardcopy disposal retains its stored place and grant records; requested hardcopy disposal clears Location and revokes grants. Disposed status restricts use. Recording disposal does not perform the organization's physical disposal procedure.

9. Accounts, roles, places and approval routes

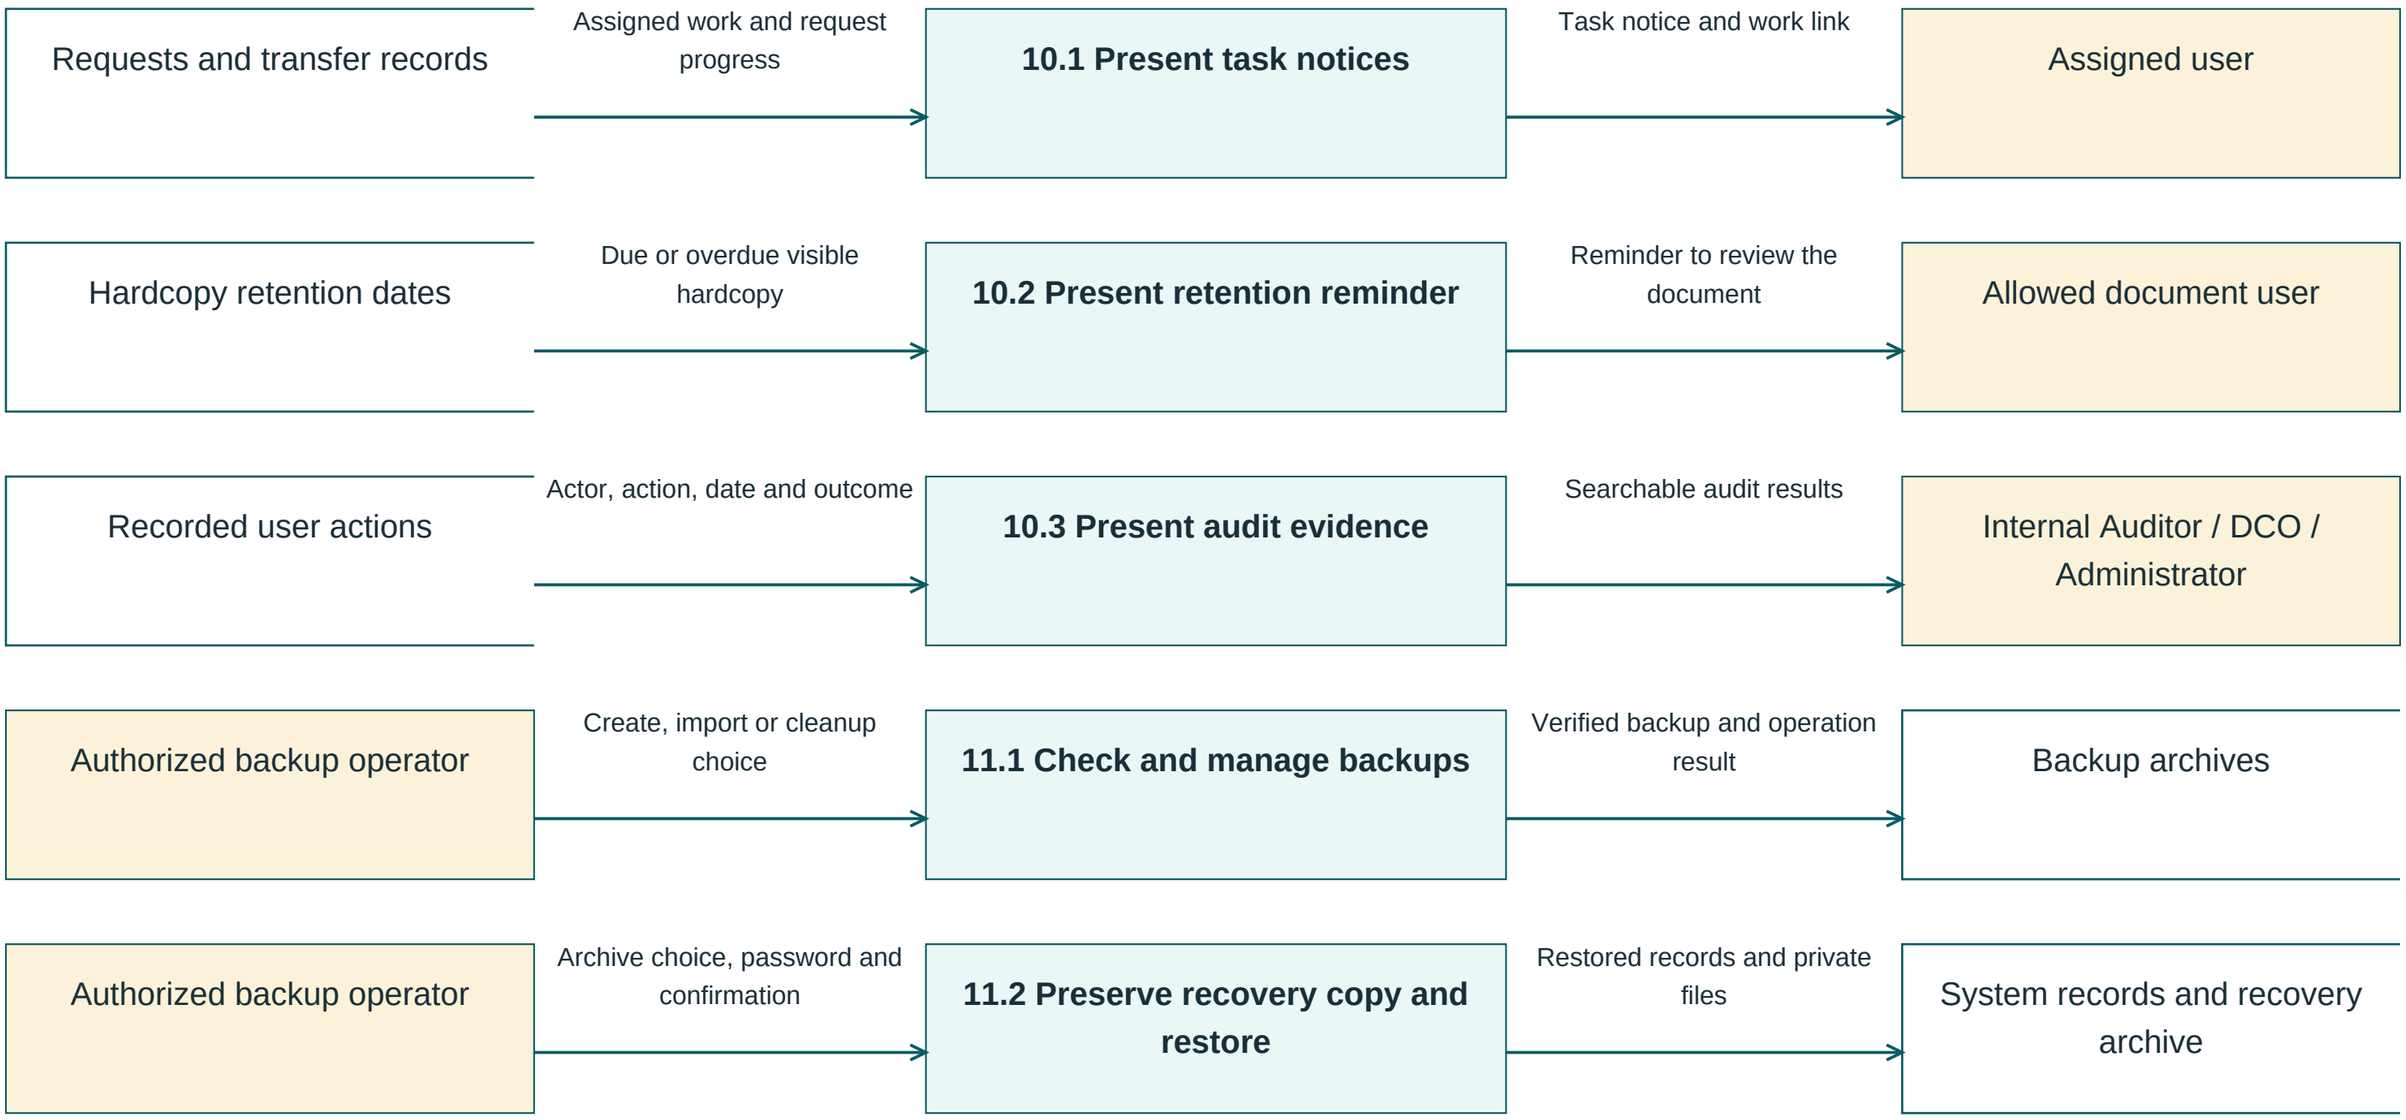

Authorized maintainers provide the reference information used by document entry and request reviews.

Primary and assigned active roles combine permissions. The supplied DCO does not automatically administer users, roles, workflows or backups. Account leadership and receiving-user duties can belong to people holding any permitted role.

10-11. Notices, audit and system recovery

Users receive notices; reviewers inspect recorded actions; authorized backup operators preserve or restore records.

Opening an alert does not complete the linked work. Automatic backups need administrator setup and evidence of a recent run. Restore replaces live records and files, temporarily blocks use, and signs the operator out after success.
